

Lab 4

Instructions:

- a. Go through the below lab instructions carefully.
 - b. Capture the relevant screenshots of all the steps and its working.
1. Create a local custom skill called “**interview-prep**” which should take a “Role” and “Number of years” as the parameter and provide 5 technical and 5 behavioural interview questions suitable for the role and number of years entered by the user so that the user can use it for his/her interview preparation.
 2. Test the skill and see whether it works fine.
 3. Now convert this local skill into shared skill so that its accessible across repositories and workspaces

The screenshot shows a VS Code editor with a file explorer on the left displaying the path `day18task \.github \skills \interview-prep` and the file `SKILL.md`. The editor window shows the content of `SKILL.md`, which defines a skill named `interview-prep`. The skill's description is: "Generate interview questions for a given role and experience level. Use when preparing for a technical interview, creating interview question sets, or practicing interview skills. Accepts role and years of experience as parameters. Produces 5 technical and 5 behavioural questions tailored to the role and seniority." The argument hint is `<role> <years of experience>`. The skill includes sections for "When to Use", "Parameters" (Role and Years of experience), and "Procedure".

On the right, a chat window titled "CREATE INTERVIEW PREP SK..." is open. It shows a prompt `/create-skill` and a response from GitHub Copilot: "Create a reusable GitHub Copilot skill called interview-prep. The skill should accept two parameters: Role, Number of years of experience. Generate: 5 technical interview questions, 5 behavioural interview questions. The questions should match the role and experience level. Return only the questions in a numbered format." Below the chat window, there is a section for "SKILL.md" with a prompt "Describe what to build" and a "Default App..." button.
